

My main concern is for the probable disruption to the Amateur Radio Service with the following points:

- 1) Interference at long distances could be a problem with modes that can detect signals in the noise floor (for example, FT8, JT65).
- 2) Interference to a nearby receiver – can be a significant problem to emergency communications.
- 3) Broadband transmitter phase/composite noise interference to nearby receivers
- 4) RF exposure issues

I believe that the Shortwave Modernization Coalition is a profit-only initiative being pushed by venture capitalists and do not have the public's interest in mind. Please reject any and all attempts for any rule makings that will unnecessarily and negatively impact current licensed services in the HF Amateur Radio Service Bands.
